Baby Kick Counter

Filed under: [Ob/Gyn](#)

Low activity of a fetus in the womb may be indicative of a problem during pregnancy, and women are often told to monitor baby kicks and count how many are felt. The kickTrak is a simple new device for mothers too neurotic to be able to count and watch the second hand of the clock at the same time.

- Each of the ten kicks during a single session is displayed on the digital screen's Kick Count Window
- A timer displays the duration of the session in minutes & hours in the Kick Count Window
- kickTrak lets moms know the baby has moved ten times by playing "Twinkle Twinkle Little Star"
- Store & recall function allows moms & healthcare providers to view the data from the ten most recent kick count sessions. Changes in the data allow a mom to promptly notify her healthcare provider of problems and potentially reduce the risk of pregnancy complications.
- The Pregnancy Progress Window shows moms how far along they are in their pregnancy, displaying how many weeks and days have passed since conception and gives an estimate of how many days are left before they'll give birth.
